I'd like to submit for your consideration the EPA explanation, hangtag, and test data on the Phase 2 OWHH program which are also available directly from the EPA website.

The argument in favor of including Phase 2 certified OWHH is simply that the emissions per 10K btu place them well within the range of emissions for the EPA certified wood and pellet stoves that you indicated would probably be allowed to be permitted in Zone M.

I know that we have issues with older technology outdoor units and we are trying to get them upgraded. As of mid 2008 we shifted our inventory to exclusively stocking the clean burning units. After visiting customers in the field we are convinced that there is an enormous advantage.

I know this is early in the process but I appreciate your consideration.

Guy
